I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

#### Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

#### Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 08459 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered YES in part 8, a Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- Part 7 should only be completed when a divisional application is being made under section 15(4), or when an application is being made under section 8(3), 12(6) or 37(4) following an entitlement dispute. By completing part 7 you are requesting that this application takes the same filing date as an earlier UK application. If you want the new application to have the same priority date(s) as the earlier UK application, you should also complete part 6 with the priority details.

## Chemical Compounds

The present invention relates to certain novel compounds. In particular, the present invention relates to compounds that activate both the alpha and gamma subtypes of the human peroxisome proliferator activated receptor. The present invention also relates to methods for preparing the compounds and methods for prevention or treatment of PPAR mediated diseases or conditions.

Several independent risk factors have been associated with cardiovascular disease. These include hypertension, increased fibrinogen levels, high levels of triglycerides, elevated LDL cholesterol, elevated total cholesterol, and low levels of HDL cholesterol. HMG CoA reductase inhibitors ("statins") are useful for treating conditions characterized by high LDL-c levels. It has been shown that lowering LDL-c is not sufficient for reducing the risk of cardiovascular disease in some patients, particularly those with normal LDL-c levels. This population pool is identified by the independent risk factor of low HDL-c. The increased risk of cardiovascular disease associated with low HDL-c levels has not yet been successfully addressed by drug therapy (i.e., currently there are no drugs on the market that are useful for raising HDL-c >40%). (Bisgaier, C. L.; Pape, M. E. *Curr. Pharm. Des.* 1998, 4, 53-70).

Syndrome X (including metabolic syndrome) is loosely defined as a collection of abnormalities including hyperinsulinemia, obesity, elevated levels of triglycerides, uric acid, fibrinogen, small dense LDL-c particles, and plasminogen activator inhibitor 1 (PAI-1), and decreased levels of HDL-c.

NIDDM is described as insulin resistance which in turn causes anomalous glucose output and a decrease in glucose uptake by skeletal muscle. These factors eventually lead to impaired glucose tolerance (IGT) and hyperinsulinemia.

Peroxisome Proliferator Activated Receptors (PPARs) are orphan receptors belonging to the steroid/retinoid receptor superfamily of ligand-activated transcription factors. See, for example, Willson, T. M. and Wahli, W., *Curr. Opin. Chem. Biol.*, (1997), Vol. 1, pp 235-241.

Three mammalian Peroxisome Proliferator-Activated Receptors have been isolated and termed PPAR-alpha, PPAR-gamma, and PPAR-delta (also known as NUC1 or PPAR-beta). These PPARs regulate expression of target genes by binding to DNA sequence elements, termed PPAR response elements (PPRE). To date, PPRE's have been identified in the enhancers of a number of genes encoding proteins that regulate lipid metabolism suggesting that PPARs play a pivotal role in the adipogenic signaling cascade and lipid homeostasis (H. Keller and W. Wahli, *Trends Endocrin. Met* 291-296, 4 (1993)).

Certain compounds that activate or otherwise interact with one or more of the PPARs have been implicated in the regulation of triglyceride and cholesterol levels in animal models. See, for example, WO 01/40207, WO 01/00603, WO 97/31907, WO 02/46174 (Glaxo Group Ltd et al).

WO 01/40207 discloses compounds of the following formula:

which are stated to be useful in the treatment of PPAR mediated diseases. The compounds are particularly described as being activators of PPAR alpha and the ring defined by Y and Z are oxazole or thiazole rings.

The present inventors have prepared compounds which possess dual activity at human PPAR alpha and human PPAR gamma and as such will be useful in the treatment of human PPAR alpha and/or gamma mediated diseases, in particular dyslipidemia. In particular, the ratio of alpha to gamma activity is predicted to provide additional benefits of lipid effects provided by the gamma component when combined with PPAR alpha activity without introducing side effects which are often associated with PPAR gamma activity.

According to a first aspect of the invention there is provided a compound of formula (I) and pharmaceutically acceptable salts, solvates and hydrolysable esters thereof:

R<sup>1</sup> and R<sup>2</sup> are independently H or C<sub>1-3</sub> alkyl;

R<sup>3</sup> and R<sup>4</sup> are independently H, C<sub>1-6</sub> alkyl, -OC<sub>1-6</sub> alkyl, halogen, OH, C<sub>2-6</sub> alkenyl, CF<sub>3</sub>;

R<sup>5</sup> is H, C<sub>1-6</sub> alkyl or CF<sub>3</sub>;

R<sup>6</sup> is C<sub>1-6</sub> alkyl (optionally substituted by one or more halogens), halogen, -OC<sub>1-6</sub> alkyl.

In another aspect, the present invention discloses a method for prevention or treatment of a human PPAR ("hPPAR") mediated disease or condition comprising administration of a therapeutically effective amount of a compound of this invention. hPPAR-mediated diseases or conditions include dyslipidemia including associated diabetic dyslipidemia and mixed dyslipidemia, syndrome X (as defined in this application this embraces metabolic syndrome), heart failure, hypercholesteremia, cardiovascular disease including atherosclerosis, arteriosclerosis, and hypertriglyceridemia, type II diabetes mellitus, type I diabetes, insulin resistance, hyperlipidemia, inflammation, epithelial hyperproliferative diseases including eczema and psoriasis and conditions associated with the lining and gut and regulation of appetite and food intake in subjects suffering from disorders such as obesity, bulimia, and anorexia nervosa. In particular, the compounds of this invention are useful in the treatment and prevention of cardiovascular diseases and conditions including atherosclerosis, arteriosclerosis, hypertriglyceridemia, and mixed dyslipidaemia.

In another aspect, the present invention provides pharmaceutical compositions comprising the compound of the invention, preferably in association with a pharmaceutically acceptable diluent or carrier.

In another aspect, the present invention provides the compound of the invention for use in therapy, and in particular, in human medicine.

5 In another aspect, the present invention provides the use of the compound of the invention for the manufacture of a medicament for the treatment of a hPPAR mediated disease or condition.

10 In another aspect, the present invention provides a method of treatment of a patient suffering from a hPPAR mediated disease or condition comprising the administration of therapeutically effective amount of the compound of the invention.

As used herein, "the compound of the invention" means a compound of formula (I) or a pharmaceutically acceptable salt, solvate, or hydrolyzable ester thereof.

15 While hydrolyzable esters are included in the scope of this invention, the acids are preferred because the data suggests that while the esters are useful compounds, it may actually be the acids to which they hydrolyze that are the active compounds. Esters that hydrolyze readily can produce the carboxylic acid in the assay conditions or in vivo. Generally the carboxylic acid is active in both the binding and transient  
20 transfection assays, while the ester does not usually bind well but is active in the transient transfection assay presumably due to hydrolysis. Preferred hydrolysable esters are C<sub>1-6</sub> alkyl esters wherein the alkyl group may be straight chain or branched chain. Methyl or ethyl esters are more preferred.

25 The compounds of the invention are modulators of PPAR alpha and PPAR gamma. Preferably they are agonists or partial agonists of the relevant PPAR..

30 The compound of formula (I) is preferably a selective dual agonist of PPAR alpha and gamma. As used herein, by "agonist", or "activating compound", or "activator", or the like, is meant those compounds which have a pKi of at least 6.0 preferably at least 7.0 to the relevant PPAR, for example hPPAR alpha in the binding assay described below, and which achieve at least 50% activation of the relevant PPAR relative to the appropriate indicated positive control in the transfection assay described below at concentrations of 10<sup>-5</sup> M or less.

Partial agonists can be defined as compounds that transactivate the relevant PPAR, for example PPAR alpha in CV1 cells with less than 50% fold activation compared to the reference PPAR alpha full agonist in the transfection assays described below.

As used herein, a "selective dual hPPAR alpha/gamma agonist" is a hPPARalpha/gamma agonist whose EC<sub>50</sub> for PPARalpha and PPAR gamma is at least 10 fold lower than its EC<sub>50</sub> for PPAR delta. EC<sub>50</sub> is defined in the transfection assay described below and is the concentration at which a compound achieves 50% of its maximum activity.

Preferably R<sup>1</sup> and R<sup>2</sup> are independently C<sub>1-3</sub> alkyl. More preferably R<sup>1</sup> and R<sup>2</sup> are both C<sub>1-3</sub> alkyl, most preferably R<sup>1</sup> and R<sup>2</sup> are both methyl.

Preferably R<sup>4</sup> is H.

Preferably R<sup>3</sup> is C<sub>1-3</sub> alkyl or -OC<sub>1-3</sub> alkyl. Most preferably R<sup>3</sup> is methyl or -OCH<sub>3</sub>. R<sup>3</sup> is preferably ortho to the depicted Oxygen.

Preferably R<sup>5</sup> is methyl.

Preferably R<sup>7</sup> is C<sub>1-6</sub> alkyl. Preferably R<sup>7</sup> is in the para position on the phenyl ring.

While the preferred groups for each variable have generally been listed above separately for each variable, preferred compounds of this invention include those in which several or each variable in Formula (I) is selected from the preferred, more preferred, or most preferred groups for each variable. Therefore, this invention is intended to include all combinations of preferred, more preferred, and most preferred groups.

Preferred compounds of the invention include:

**Example 1:**

2-[(4-[[{5-[4-(1,1-dimethylethyl)phenyl]-1-methyl-1*H*-pyrazol-3-yl}carbonyl)amino]methyl]-2-methylphenyl)oxy]-2-methylpropanoic acid;

**Example 2:**

2-methyl-2-[(2-methyl-4-[[{1-methyl-3-[4-(1-methylethyl)phenyl]-1*H*-pyrazol-5-yl}carbonyl)amino]methyl]phenyl)oxy]propanoic acid.

**Example 3:**

2-[[4-[[[3-[4-(1,1-dimethylethyl)phenyl]-1-methyl-1*H*-pyrazol-5-yl]carbonyl]amino]methyl]-2-(2-propen-1-yl)phenyl]oxy]-2-methylpropanoic acid.

**Example 4:**

5 2-[[4-[[[3-[4-(1,1-dimethylethyl)phenyl]-1-methyl-1*H*-pyrazol-5-yl]carbonyl]amino]methyl]-2-propylphenyl]oxy]-2-methylpropanoic acid;

**Example 5:**

2-[[4-[[[3-[4-(1,1-dimethylethyl)phenyl]-1-ethyl-1*H*-pyrazol-5-yl]carbonyl]amino]methyl]-2-(methyloxy)phenyl]oxy]-2-methylpropanoic acid.

10 **Example 6:**

2-[[4-[[[5-[4-(1,1-dimethylethyl)phenyl]-1-ethyl-1*H*-pyrazol-3-yl]carbonyl]amino]methyl]-2-(methyloxy)phenyl]oxy]-2-methylpropanoic acid.

**Example 7:**

15 2-methyl-2-[(2-methyl-4-[[[1-methyl-5-[4-(2-methylpropyl)phenyl]-1*H*-pyrazol-3-yl]carbonyl]amino]methyl]phenyl]oxy]propanoic acid

**Example 8:**

2-methyl-2-[(2-methyl-4-[[[1-methyl-3-[4-(2-methylpropyl)phenyl]-1*H*-pyrazol-5-yl]carbonyl]amino]methyl]phenyl]oxy]propanoic acid;

**Example 9:**

20 2-methyl-2-[[4-[[[1-methyl-5-[4-(1-methylethyl)phenyl]-1*H*-pyrazol-3-yl]carbonyl]amino]methyl]-2-(methyloxy)phenyl]oxy]propanoic acid;

**Example 10:**

2-methyl-2-[[4-[[[1-methyl-3-[4-(1-methylethyl)phenyl]-1*H*-pyrazol-5-yl]carbonyl]amino]methyl]-2-(methyloxy)phenyl]oxy]propanoic acid;

25 **Example 11:**

2-[[4-[[[3-[4-(1,1-dimethylethyl)phenyl]-1-methyl-1*H*-pyrazol-5-yl]carbonyl]amino]methyl]-2-methylphenyl]oxy]-2-methylpropanoic acid;

**Example 12:**

30 2-[[4-[[[3-[4-(1,1-dimethylethyl)phenyl]-1-methyl-1*H*-pyrazol-5-yl]carbonyl]amino]methyl]-2-(methyloxy)phenyl]oxy]-2-methylpropanoic acid;

**Example 13:**

2-[[4-[[[5-[4-(1,1-dimethylethyl)phenyl]-1-ethyl-1*H*-pyrazol-3-yl]carbonyl]amino]methyl]-2-methylphenyl]oxy]-2-methylpropanoic acid;

**Example 14:**

2-methyl-2-[[4-[[[1-methyl-5-[4-(2-methylpropyl)phenyl]-1*H*-pyrazol-3-yl]carbonyl]amino]methyl]-2-(methoxy)phenyl]oxy]propanoic acid;

**Example 15:**

2-[[4-[[[3-[4-(1,1-dimethylethyl)phenyl]-1-ethyl-1*H*-pyrazol-5-yl]carbonyl]amino]methyl]-2-methylphenyl]oxy]-2-methyl propanoic acid.

**Example 16:**

2-[[4-[[[3-[4-(1,1-dimethylethyl)phenyl]-1-methyl-1*H*-pyrazol-5-yl]carbonyl]amino]methyl]phenyl]oxy]-2-methylpropanoic acid

**Example 17:**

2-[[4-[[[5-[4-(1,1-dimethylethyl)phenyl]-1-methyl-1*H*-pyrazol-3-yl]carbonyl]amino]methyl]phenyl]oxy]-2-methylpropanoic acid.

**Example 18:**

2-methyl-2-[(2-methyl-4-[[[1-methyl-5-[4-(1-methylethyl)phenyl]-1*H*-pyrazol-3-yl]carbonyl]amino]methyl]phenyl]oxy]propanoic acid;

It will be appreciated by those skilled in the art that the compounds of the present invention may also be utilized in the form of a pharmaceutically acceptable salt or solvate thereof. The physiologically acceptable salts of the compounds of formula (I) include conventional salts formed from pharmaceutically acceptable inorganic or organic acids or bases as well as quaternary ammonium acid addition salts. More specific examples of suitable acid salts include hydrochloric, hydrobromic, sulfuric, phosphoric, nitric, perchloric, fumaric, acetic, propionic, succinic, glycolic, formic, lactic, maleic, tartaric, citric, palmoic, malonic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, fumaric, toluenesulfonic, methanesulfonic, naphthalene-2-sulfonic, benzenesulfonic hydroxynaphthoic, hydroiodic, malic, steroic, tannic and the like. Other acids such as oxalic, while not in themselves pharmaceutically acceptable, may be useful in the preparation of salts useful as intermediates in obtaining the compounds of the invention and their pharmaceutically acceptable salts. More specific examples of suitable basic salts include sodium, lithium, potassium, magnesium, aluminium, calcium, zinc, N,N'-dibenzylethylenediamine, chloroprocaine, choline, diethanolamine, ethylenediamine, N-methylglucamine and procaine salts. References hereinafter to a compound according to the invention include both compounds of formula (I) and their pharmaceutically acceptable salts and solvates.

The compound of the invention and its pharmaceutically acceptable derivatives are conveniently administered in the form of pharmaceutical compositions. Such compositions may conveniently be presented for use in conventional manner in admixture with one or more physiologically acceptable carriers or excipients.

While it is possible that compounds of the present invention may be therapeutically administered as the raw chemical, it is preferable to present the active ingredient as a pharmaceutical formulation. The carrier(s) must be "acceptable" in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

Accordingly, the present invention further provides for a pharmaceutical formulation comprising a compound of formula (I) or a pharmaceutically acceptable salt or solvate thereof together with one or more pharmaceutically acceptable carriers therefore and, optionally, other therapeutic and/or prophylactic ingredients.

The formulations include those suitable for oral, parenteral (including subcutaneous e.g. by injection or by depot tablet, intradermal, intrathecal, intramuscular e.g. by depot and intravenous), rectal and topical (including dermal, buccal and sublingual) administration although the most suitable route may depend upon for example the condition and disorder of the recipient. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing into association the compounds ("active ingredient") with the carrier which constitutes one or more accessory ingredients. In general the formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both and then, if necessary, shaping the product into the desired formulation.

Formulations suitable for oral administration may be presented as discrete units such as capsules, cachets or tablets (e.g. chewable tablets in particular for paediatric administration) each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The active ingredient may also be presented as a bolus, electuary or paste.

A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with a other conventional excipients such as binding agents, (for example, syrup, acacia, gelatin, sorbitol, tragacanth, mucilage of starch or polyvinylpyrrolidone), fillers (for example, lactose, sugar, microcrystalline cellulose, maize-starch, calcium phosphate or sorbitol), lubricants (for example, magnesium stearate, stearic acid, talc, polyethylene glycol or silica), disintegrants (for example, potato starch or sodium starch glycollate) or wetting agents, such as sodium lauryl sulfate. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active ingredient therein. The tablets may be coated according to methods well-known in the art.

Alternatively, the compounds of the present invention may be incorporated into oral liquid preparations such as aqueous or oily suspensions, solutions, emulsions, syrups or elixirs, for example. Moreover, formulations containing these compounds may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents such as sorbitol syrup, methyl cellulose, glucose/sugar syrup, gelatin, hydroxyethylcellulose, carboxymethyl cellulose, aluminum stearate gel or hydrogenated edible fats; emulsifying agents such as lecithin, sorbitan mono-oleate or acacia; non-aqueous vehicles (which may include edible oils) such as almond oil, fractionated coconut oil, oily esters, propylene glycol or ethyl alcohol; and preservatives such as methyl or propyl p-hydroxybenzoates or sorbic acid. Such preparations may also be formulated as suppositories, e.g., containing conventional suppository bases such as cocoa butter or other glycerides.

Formulations for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents.

The formulations may be presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilised) condition requiring only the addition of a sterile liquid carrier, for example, water-for-injection, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets of the kind previously described.

Formulations for rectal administration may be presented as a suppository with the usual carriers such as cocoa butter, hard fat or polyethylene glycol.

Formulations for topical administration in the mouth, for example buccally or sublingually, include lozenges comprising the active ingredient in a flavoured basis such as sucrose and acacia or tragacanth, and pastilles comprising the active ingredient in a basis such as gelatin and glycerin or sucrose and acacia.

The compounds may also be formulated as depot preparations. Such long acting formulations may be administered by implantation (for example subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the compounds may be formulated with suitable polymeric or hydrophobic materials (for example as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

In addition to the ingredients particularly mentioned above, the formulations may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavouring agents.

It will be appreciated by those skilled in the art that reference herein to treatment extends to prophylaxis as well as the treatment of established diseases or symptoms. Moreover, it will be appreciated that the amount of a compound of the invention required for use in treatment will vary with the nature of the condition being treated and the age and the condition of the patient and will be ultimately at the discretion of the attendant physician or veterinarian. In general, however, doses employed for adult human treatment will typically be in the range of 0.02-5000 mg per day, preferably 1-1500 mg per day. The desired dose may conveniently be presented in a single dose or as divided doses administered at appropriate

intervals, for example as two, three, four or more sub-doses per day. The formulations according to the invention may contain between 0.1-99% of the active ingredient, conveniently from 30-95% for tablets and capsules and 3-50% for liquid preparations.

5

The compound of formula (I) for use in the instant invention may be used in combination with other therapeutic agents for example, statins and/or other lipid lowering drugs for example MTP inhibitors and LDLR upregulators. The compounds of the invention may also be used in combination with antidiabetic agents, e.g. metformin, sulfonylureas and/or PPAR gamma agonists (for example thiazolidinediones such as e.g. Pioglitazone and Rosiglitazone). The compounds may also be used in combination with antihypertensive agents such as calcium channel antagonists and ACE inhibitors. The invention thus provides in a further aspect the use of a combination comprising a compound of formula (I) with a further therapeutic agent in the treatment of a hPPAR mediated disease.

10

15

When the compounds of formula (I) are used in combination with other therapeutic agents, the compounds may be administered either sequentially or simultaneously by any convenient route.

20

The combinations referred to above may conveniently be presented for use in the form of a pharmaceutical formulation and thus pharmaceutical formulations comprising a combination as defined above optimally together with a pharmaceutically acceptable carrier or excipient comprise a further aspect of the invention. The individual components of such combinations may be administered either sequentially or simultaneously in separate or combined pharmaceutical formulations.

25

When combined in the same formulation it will be appreciated that the two compounds must be stable and compatible with each other and the other components of the formulation and may be formulated for administration. When formulated separately they may be provided in any convenient formulation, conveniently in such a manner as are known for such compounds in the art.

30

When a compound of formula (I) is used in combination with a second therapeutic agent active against the same hPPAR mediated disease, the dose of each

Routes of synthesis for the general structure depicted below:

**-For R<sup>5</sup>=Me, the following general route was used (see below) :**

-For  $R^5 = \text{Et}$ , the following route was used (see below) :

It is submitted the above schemes are illustrative and a skilled person would be able to adapt to prepare compounds with other R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup> and R<sup>6</sup> groups as appropriate using these teachings and those in the specific examples below.

The invention will now be demonstrated by the following examples which should not be construed as constituting a limitation thereto.

As used herein the symbols and conventions used in these processes, schemes and examples are consistent with those used in the contemporary scientific literature, for example, the Journal of the American Chemical Society or the Journal of Biological Chemistry. Unless otherwise noted, all starting materials were obtained from commercial suppliers and used without further purification.

Specifically, the following abbreviations may be used in the examples and throughout the specification:

g (grams); mg (milligrams); L (liters); mL (milliliters);  $\mu$ L (microliters); mM (millimolar);  
mol (moles); mmol (millimoles); rt (room temperature); min (minutes); h (hours);  
MeOH (methanol); EtOH (ethanol); THF (tetrahydrofuran); AcOEt (ethyl acetate);  
Ac (acetyl).

All references to ether are to diethyl ether; brine refers to a saturated aqueous solution of NaCl. Unless otherwise indicated, all temperatures are expressed in  $^{\circ}$ C (degrees Centigrade).

## EXAMPLES

### Intermediate 1

#### Ethyl (2Z)-4-[4-(1,1-dimethylethyl)phenyl]-2-hydroxy-4-oxo-2-butenate

7.91 g of Na was added to 1L of EtOH in a 3L neck flask under nitrogen atmosphere at  $0^{\circ}$ C. A solution of 55g of p-tert-Butylacetophenone in 100mL of EtOH was added dropwise to the resulting solution and the reaction mixture was stirred for 45 min at  $0^{\circ}$ C. 50.2g of ethyl oxalate in 100 mL of EtOH was then added dropwise. The reaction mixture was stirred for 16h at rt then for 4h at  $80^{\circ}$ C. The evolution of the reaction was monitored by LC/MS. The reaction mixture was cooled at rt and concentrated under vacuum. 1 L of ethyl acetate was added and the organic layer washed with brine, (HCl 1N) x2, and brine.

The organic layer was dried with  $\text{Na}_2\text{SO}_4$ , after filtration and evaporation under vacuum, 86g of orange oil was obtained.

#### Intermediate 26

Ethyl 3-[4-(1,1-dimethylethyl)phenyl]-1H-pyrazole-5-carboxylate

Hydrazine hydrate (13.4 mL, 0.276 mol) was added to a solution of **intermediate 1** (76.2 g, 0.276 mol) in 750 mL of ethanol under a nitrogen atmosphere and the mixture was heated at 90°C for 3 hours. The yellow crystals were separated by filtered and the red filtrate was cooled down promoting the formation of a second crop of yellow crystals which were filtrated too. Ethanol was evaporated and the residue was diluted in the minimum amount of CH<sub>2</sub>CL<sub>2</sub> promoting precipitation of a white solid filtered off and rinsed with CH<sub>2</sub>CL<sub>2</sub> affording the title compound as a white powder (37.8 g).

### Intermediate 27

#### Ethyl 3-[4-(1,1-dimethylethyl)phenyl]-1-ethyl-1H-pyrazole-5-carboxylate.

K<sub>2</sub>CO<sub>3</sub> (28.7 g, 207 mmol) and ethyl iodide (27.9 mL, 346 mmol) was added to a solution of **intermediate 26** (18.8 g, 69 mmol) in 500 mL of acetone. The reaction mixture was heated at 70 °C for 19h30 under a nitrogen atmosphere and after cooling down, the inorganic salts were filtered and the filtrate was evaporated to dryness. The resulting solid was diluted in EtOAc and water and the organic layer was separated and washed with 1N HCl and then with brine. The organic layer was dried over sodium sulfate and evaporated to dryness and then purified by flash chromatography on silica gel (cyclohexane/EtOAc = 90/10 to 80/20) to afford the title compound as a yellow oil which crystallizes on standing (14.4 g). The other N-Et isomer was also purified (5.4 g, 26% yield).

### Intermediate 33

#### Ethyl 4-[4-(2-methylpropyl)phenyl]-2,4-dioxobutanoate.

Sodium (2.53 g, 0.11 mol) was added portionwise at  $0^\circ\text{C}$  in 200 mL of anhydrous ethanol under a nitrogen atmosphere. After dissolution was completed, a solution of 4'-isobutylacetophenone (17.6 g, 0.1 mol) in 30 mL of anhydrous ethanol was added dropwise at  $0^\circ\text{C}$ . When the addition was over, the mixture was stirred at  $0^\circ\text{C}$  for 30 minutes and a solution of ethyloxalate (16.06 g, 0.11 mol) in 25 mL of anhydrous ethanol was added dropwise. The mixture was stirred at rt for 16 hours and evaporated under reduced pressure. The oily product was dissolved in AcOEt and washed with 1N HCl (2x), with brine (1x), dried over  $\text{Na}_2\text{SO}_4$ , filtered and evaporated to dryness giving the title compound as an orange oil (28 g). The crude product was used without further purification (8% of starting material is remaining).

Ethyl 2-methyl-2-{4-[[1-methyl-5-[4-(1-methylethyl)phenyl]-1H-pyrazol-3-yl]carbonyl]amino}methyl-2-(methyloxy)phenyl]oxy}propanoate.

Intermediate 20 (105 mg, 0.43 mmol) was dissolved in 3 mL of DMF, HOBT (58 mg, 0.43 mmol), EDCI (82 mg, 0.43 mmol), Et<sub>3</sub>N (120 μL, 0.86 mmol) and Intermediate 15 (144 mg, 0.5 mmol) were successively added. The mixture was stirred at rt for 24 hours and was diluted with EtAOc and washed with a sat. NaHCO<sub>3</sub> solution and brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness. The product was then purified by flash chromatography on silica gel (CH<sub>2</sub>Cl<sub>2</sub>/AcOEt = 95/5) to afford the title compound as 205 mg of a pale oil.

2-[(4-[[[5-[4-(1,1-dimethylethyl)phenyl]-1-methyl-1H-pyrazol-3-yl]carbonyl]amino[methyl]phenyl]oxy]-2-methylpropanoic acid.

13.4 mL of NaOH (1N) was added to a solution of 3.2 g (6.7 mmol) of **Intermediate 50** in 64 mL of EtOH.

After 1h10 at 70°C, the mixture was allowed to go to room temperature, then 50 mL of water was added and the organic layer extracted twice with 25 mL of AcOEt. The aqueous layer was acidified with HCl (1N) and the organic layer extracted with 30 mL of CH<sub>2</sub>Cl<sub>2</sub>, dried on MgSO<sub>4</sub>, filtered and evaporated to dryness to give the title compound as a white solid.

To a solution of 105 mg (0.43 mmol) of Intermediate 20 in 3 mL of DMF was added successively 58 mg of HOBT, 82 mg of EDCI, 120  $\mu$ L of Et<sub>3</sub>N and 113 mg of Intermediate 12.

The reaction mixture was stirred for 24h at room temperature, extracted with ethylacetate, washed with brine, dried on Na<sub>2</sub>SO<sub>4</sub> and evaporated to dryness.

The residue was purified by chromatography (Dichloromethane/ethyl- acetate 95/5). Yield=78%

## BINDING AND TRANSFECTION ASSAYS

### **Binding Assay:**

Compounds were tested for their ability to bind to hPPAR gamma hPPARalpha or PPARdelta using a Scintillation Proximity Assay (SPA). The PPAR ligand binding domain (LBD) was expressed in *E. coli* as polyHis tagged fusion proteins and purified. The LBD was then labelled with biotin and immobilised on streptavidin-modified scintillation proximity beads. The beads were then incubated with a constant amount of the appropriate radioligand (5-{4-[2-(Methyl-pyridin-2-yl-amino)-ethoxy]-benzyl}-thiazolidine-2,4-dione (*J.Med.Chem.* 1994, 37(23), 3977), for PPARgamma), and labelled GW 2433 (see Brown, P. J et al . *Chem. Biol.*, 4, 909-918 (1997), for the structure and synthesis of this ligand) for PPAR alpha and PPAR delta) and variable concentrations of test compound, and after equilibration the radioactivity bound to the beads was measured by a scintillation counter. The amount of nonspecific binding, as assessed by control wells containing 50 μM of the corresponding unlabeled ligand, was subtracted from each data point. For each compound tested, plots of ligand concentration vs. CPM of radioligand bound were constructed and apparent K<sub>i</sub> values were estimated from nonlinear least squares fit of the data assuming simple competitive binding. The details of this assay have been reported elsewhere (see, Blanchard, S. G. et. al. Development of a Scintillation Proximity Assay for Peroxisome Proliferator-Activated Receptor gamma Ligand Binding Domain. *Anal. Biochem.*, 257, 112-119 (1998)).

**Transfection assay:**

Compounds were screened for functional potency in transient transfection assays in CV-1 cells for their ability to activate the PPAR subtypes (transactivation assay). A previously established chimeric receptor system was utilized to allow comparison of the relative transcriptional activity of the receptor subtypes on the same target gene and to prevent endogenous receptor activation from complicating the interpretation of results. See, for example, Lehmann, J. M.; Moore, L. B.; Smith-Oliver, T. A.; Wilkison, W. O.; Willson, T. M.; Kliewer, S. A., An antidiabetic thiazolidinedione is a high affinity ligand for peroxisome proliferator-activated receptor gamma (PPARgamma), *J. Biol. Chem.*, 270, 12953-6 (1995). The ligand binding domains for murine and human PPAR alpha, PPAR gamma, and PPAR delta were each fused to the yeast transcription factor GAL4 DNA binding domain. CV-1 cells were transiently transfected with expression vectors for the respective PPAR chimera along with a reporter construct containing five copies of the GAL4 DNA binding site driving expression of secreted placental alkaline phosphatase (SPAP) and beta-galactosidase. After 16 h, the medium was exchanged to DME medium supplemented with 10% delipidated fetal calf serum and the test compound at the appropriate concentration. After an additional 24h, cell extracts were prepared and assayed for alkaline phosphatase and  $\beta$ -galactosidase activity. Alkaline phosphatase activity was corrected for transfection efficiency using the beta-galactosidase activity as an internal standard (see, for example, Kliewer, S. A., et. al. *Cell* 83, 813-819 (1995)). Rosiglitazone (BRL 49653) was used as a positive control in the hPPAR gamma assay. The positive control in the hPPAR alpha assays was 2-4-[2-(3-[4-fluorophenyl]-1-heptylureido)ethyl]-phenoxy-(2-methyl propionic acid (WO 97/36579). The positive control for PPAR delta assays was 2-{2-methyl-4-[(4-methyl-2-(trifluoromethyl)phenyl)-1,3-thiazol-5-yl]methyl)sulfanyl}phenoxy}acetic acid (WO 01/00603). The positive control was (5-{4-[2-(Methyl-pyridin-2-yl-amino)-ethoxy]-benzyl}-thiazolidine-2,4-dione (*J. Med. Chem.* 1994, 37(23), 3977), for PPAR gamma.

Activities in three hPPAR subtypes are reported in the table and are expressed in micromolar.

The application of which this description and claims forms part may be used as a basis for priority in respect of any subsequent application. The claims of such subsequent application may be directed to any novel feature or combination of features described herein. This may take the form of product, composition, process or use claims any include, by way of example and without limitation, one or more of the following claims.

What is claimed is:

1. A compound of formula (I) and pharmaceutically acceptable salts, solvates and hydrolysable esters thereof

R<sup>1</sup> and R<sup>2</sup> are independently H or C<sub>1-3</sub> alkyl;

R<sup>3</sup> and R<sup>4</sup> are independently H, C<sub>1-6</sub> alkyl, -OC<sub>1-6</sub> alkyl, halogen, OH, C<sub>2-6</sub> alkenyl, CF<sub>3</sub>

R<sup>5</sup> is H, C<sub>1-6</sub> alkyl or CF<sub>3</sub>,

R<sup>7</sup> is C<sub>1-6</sub> alkyl (optionally substituted by one or more halogens), halogen, OC<sub>1-6</sub> alkyl,

2. A compound according to claim 1 which is a selective hPPAR alpha/gamma agonist.

3. A compound according to claim 1 or 2 wherein R<sup>1</sup> and R<sup>2</sup> are independently C<sub>1-3</sub> alkyl.

4. A compound according to claim 3 wherein R<sup>1</sup> and R<sup>2</sup> are both C<sub>1-3</sub> alkyl.

5. A compound according to claim 4 wherein R<sup>1</sup> and R<sup>2</sup> are both methyl.

6. A compound according to claims 1 - 5 wherein R<sup>4</sup> is H.

7. A compound according to claims 1 - 6 wherein R<sup>3</sup> is -C<sub>1-3</sub> alkyl or -OC<sub>1-3</sub> alkyl

8. A compound according to claim 7 wherein R<sup>3</sup> is methyl or -OCH<sub>3</sub>.

9. A compound according to claims 1 - 8 wherein R<sup>3</sup> is ortho to the depicted oxygen.

10. A compound according to claims 1 - 9 wherein R<sup>3</sup> is methyl.
11. A compound according to claims 1 - 10 wherein R<sup>7</sup> is C<sub>1-3</sub> alkyl.
12. A compound according to claims 1 - 11 wherein R<sup>7</sup> is in the para position.
13. A compound according to claim 1 selected from
